#### Abstract

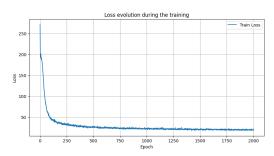

In this file, we test several architectures for some well known datasets. Each time, we first present the parameters and the architecture of the encoder and decoder. Then, we plot the results.

# 1 First test with the MNIST dataset (convolutional encoder and decoder)

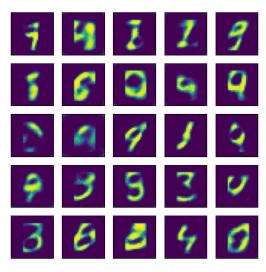

## **Encoder Architecture**

## Decoder Architecture

## **Model Parameters**

(a) Loss during the training

(c) Generated images

(b) Images and their reconstructed version

(d) Smooth transition between two images

Figure 1: Test of the architecture and the parameters presented above for the MNIST dataset

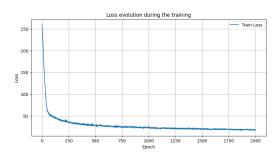

# 2 Second test with the MNIST dataset (dense encoder and decoder)

```
number_of_neurons = 128
```

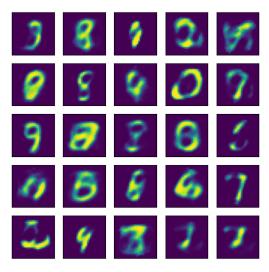

## **Encoder Architecture**

## Decoder Architecture

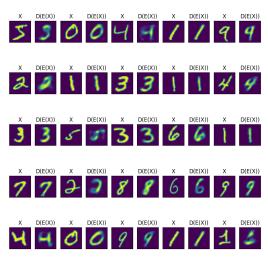

## **Model Parameters**

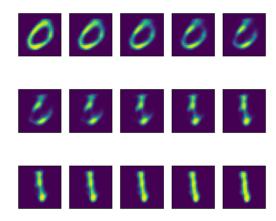

(a) Loss during the training

(c) Generated images

(b) Images and their reconstructed version

(d) Smooth transition between two images

Figure 2: Test of the architecture and the parameters presented above for the MNIST dataset

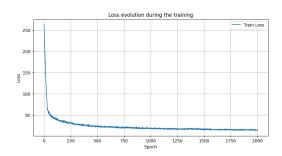

3 Third test with the MNIST dataset (dense encoder and decoder with more neurons)

```
number_of_neurons = 256
```

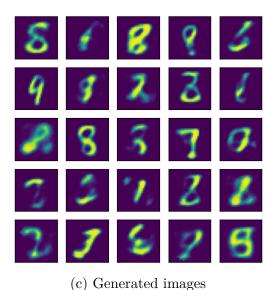

## **Encoder Architecture**

## Decoder Architecture

## **Model Parameters**

(a) Loss during the training

D(E(X)) X D(E(X)) X D(E(X)) X

(d) Smooth transition between two images

Figure 3: Test of the architecture and the parameters presented above for the MNIST dataset

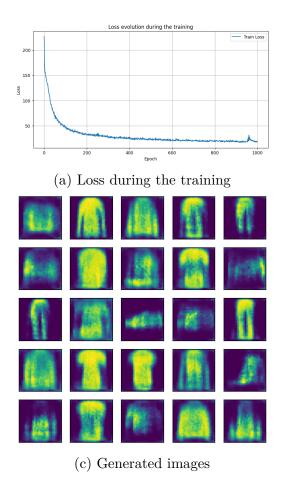

## 4 Test with the Fashion-MNIST dataset

## **Encoder Architecture**

## Decoder Architecture

## **Model Parameters**

```
1 fashion_mnist_parameters = {
      'input_dim': (28, 28, 1),
      '1D_data': False,
      'latent_dim': 12
4
 }
5
6
7 fashion_mnist_training_parameters = {
      'dataset': train_images_fashion_mnist / 255.0,
      'learning_rate': 0.0005,
      'epochs': 1000,
10
      'batch_size': 200
11
12 }
```

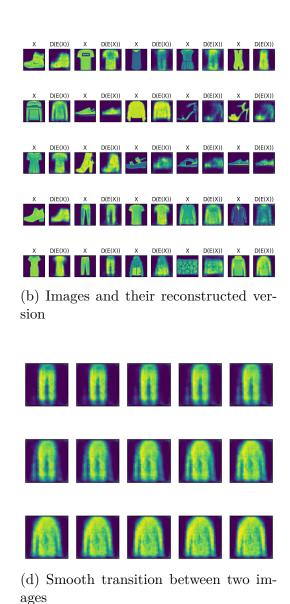

Figure 4: Test of the architecture and the parameters presented above for the Fashion-MNIST dataset

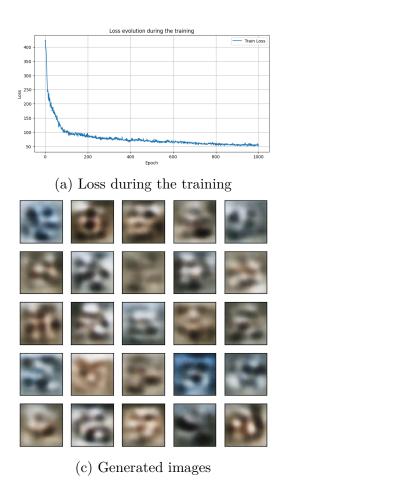

## 5 Test with the CIFAR-10 dataset

## **Encoder Architecture**

## Decoder Architecture

```
cifar10_decoder = tf.keras.Sequential([
                  InputLayer(input_shape = cifar10_parameters['latent_dim']),
                  Dense(128, activation='relu'),
                  Dense(16*16*32, activation='relu'),
4
                  Reshape((16,16,32)),
5
                  Conv2DTranspose(32, (2, 2), padding = 'same', activation='
6
    relu'),
                  Conv2DTranspose(32, (2, 2), padding = 'same', activation='
    relu'),
                  Conv2DTranspose(32, (3, 3), strides = (2,2), activation=
    relu'),
                  Conv2D(3, (2, 2), activation='sigmoid')
9
             ])
```

## **Model Parameters**

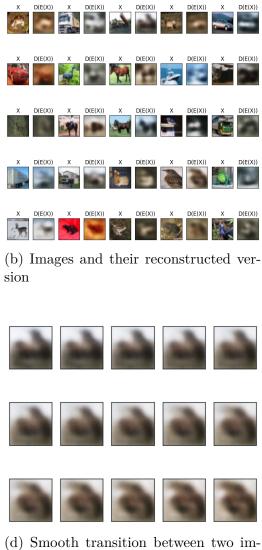

Figure 5: Test of the architecture and the parameters presented above for the CIFAR-10 dataset

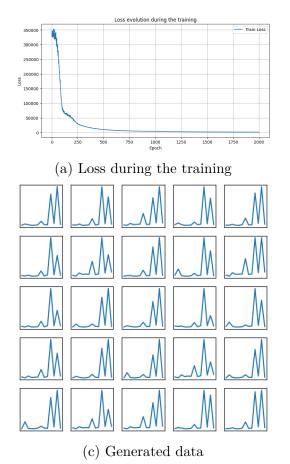

ages

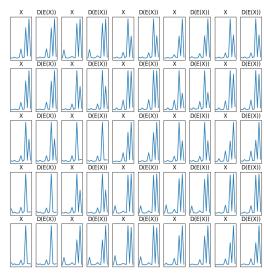

## 6 Test with the Boston Housing dataset (1D data)

## **Encoder Architecture**

## Decoder Architecture

## **Model Parameters**

(b) Initial data and their reconstructed version

(d) Smooth transition between two data

Figure 6: Test of the architecture and the parameters presented above for 1D data of the Boston Housing data set
